

Project Development Phase

Model Performance Test

Date	1 October 2026
Team ID	SWUID2026351977
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	

Model Performance Testing:

The project team shall document the behaviour of the Flow Designer automation using functional test cases and execution evidence.

S.No.	Parameter	Values	Screenshot
1.	Model Summary	A ServiceNow Flow Designer automation handles standard laptop procurement. A catalog request starts the flow, request details are checked, approval is processed, and a procurement/fulfilment task is generated. The requester receives the required status notification.	[Insert screenshot of the configured flow]
2.	Accuracy	Training Accuracy – Not applicable because this is a rule-based ServiceNow workflow and does not use ML training. Validation Accuracy – Test cases passed: ____ / ____ (____ %).	[Insert flow execution / test result screenshot]
3.	Confidence Score (Only YOLO Projects)	Not applicable. This project is a ServiceNow Flow Designer automation and does not use YOLO/object detection.	Not applicable
4.	Fine Tuning Result (if done)	Validation Accuracy – ____ % after refining the request conditions, approval logic, task creation and notification steps.	[Insert re-test screenshot if applicable]

Project Development Phase

Performance Test

Date	1 October 2026
Team ID	SWUID2026351977
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	

Model Performance Testing:

Functional validation is performed by submitting sample laptop requests and checking the resulting flow execution.

S.No.	Parameter	Screenshot / Values
1.	Data Rendered	Laptop request information such as requester, selected laptop model, quantity and business justification is displayed in the flow execution details. [Insert screenshot]
2.	Data Preprocessing	The catalog request inputs are validated before processing. Request variables are mapped to the corresponding data pills used by the flow. [Insert screenshot]
3.	Utilization of Filters	Flow conditions and record lookups are used to verify the selected standard laptop item and approval-related conditions. [Insert screenshot]
4.	DAX Queries Used	Not applicable because this is a ServiceNow Flow Designer implementation and does not use Power BI or DAX.
5.	Dashboard Design	Number of visualizations/graphs – Not applicable unless a ServiceNow dashboard has been created. [Insert screenshot if available]
6.	Report Design	Number of visualizations/graphs – Not applicable unless a report has been created. [Insert screenshot if available]

Project Development Phase

Performance Test

Date	1 October 2026
Team ID	SWUID2026351977
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	

Functional Performance Testing:

The following checks confirm that the request data is correctly handled by the automation.

S.No.	Parameter	Screenshot / Values
1.	Data Rendering	The submitted laptop request record is visible in execution details with requester information, laptop selection, quantity and justification. [Insert screenshot]
2.	Input Validation	Required request values are checked before the flow continues. Missing or invalid values prevent the next processing stage. [Insert screenshot]
3.	Condition / Filter Usage	Decision conditions determine whether the selected item follows the standard laptop procurement path and whether approval is required. [Insert screenshot]
4.	Calculation Fields Used	No Tableau calculation fields are used. Only Flow Designer variables, data pills and conditions are used where required.
5.	Dashboard Design	No dashboard visualizations are required for the core workflow. If a dashboard is added, attach its screenshot here.
6.	Story Design	No story/visual analytics page is required for this workflow. Mark as Not Applicable unless one has been created.

Test Execution & Result Summary:

Sample requests are executed to confirm that the automation responds correctly to valid inputs and follows the configured approval and fulfilment path.

S.No.	Test Case	Result / Evidence
1.	Valid Request Test	A standard laptop request with all required details should start the flow successfully and proceed to the configured approval/fulfilment stages. Result: PASS / FAIL [Insert execution screenshot]
2.	Invalid / Incomplete Request	A request with missing or incorrect information should be stopped or handled according to the validation conditions configured in the flow. Result: PASS / FAIL [Insert execution screenshot]
3.	Approval Verification	The configured approval step should route the request to the appropriate approver before procurement/fulfilment processing continues. Result: PASS / FAIL [Insert screenshot]
4.	Task Creation	After the required conditions are satisfied, the procurement/fulfilment task should be generated with the relevant request information. Result: PASS / FAIL [Insert screenshot]
5.	Notification Check	The requester should receive the configured notification or status update after the relevant flow action is completed. Result: PASS / FAIL [Insert screenshot]
6.	Overall Validation	Test cases passed: ____ / ____ (____ %). Final validation accuracy: ____ %. Remarks: _____
